

Queries Used to Read IBRS Data into ACCESS 97

The Justice Research and Statistics Association Incident-Based Resource Center
www.jrsa.org/ibrrc

Queries are used to read state-level incident-based data into ACCESS 97. These queries can be downloaded as part of the [ACCESS 97 Executable File](#). The following code creates the tables and variables necessary to read the data into ACCESS. If you need any assistance working with the information provided, [please contact us](#) at ibrrc@jrsa.org.

ADMINISTRATIVE Segment

Query **mkADMINISTRATIVE_Table** is a data definition query that creates the ADMINISTRATIVE table structure. The table fields are named and data types are set when this query is executed:

```
CREATE TABLE ADMINISTRATIVE (SEG TEXT(2), UID TEXT(21), INC_YYYY LONG, INC_MM LONG, INC_DD LONG, RPTDT_INDIC TEXT(1), INC_HR LONG, CLR_EX TEXT(1), CLR_EX_YYYY LONG, CLR_EX_MM LONG, CLR_EX_DD LONG)
```

Query **mkADMINISTRATIVE_Index** creates the ADMINISTRATIVE table index. Field UID is used as the index. This same field is also set as the key field for the table:

```
CREATE INDEX PrimaryKey ON ADMINISTRATIVE(UID) WITH PRIMARY
```

Query **appADMINISTRATIVE_Data** is an append query that formats the data from segment-level file SEG01.txt and loads it into table ADMINISTRATIVE (SEG01.txt is known to the query as SEG01):

```
INSERT INTO ADMINISTRATIVE ( SEG, UID, INC_YYYY, INC_MM, INC_DD, RPTDT_INDIC, INC_HR, CLR_EX, CLR_EX_YYYY, CLR_EX_MM, CLR_EX_DD )  
SELECT IIf(LEFT([Field1],1)=' ',Null,LEFT([Field1],1)), IIf(MID([Field1],13,21)=' ',Null,MID([Field1],13,21)),  
IIf(MID([Field1],34,4)=' ',Null,VAL(MID([Field1],34,4))), IIf(MID([Field1],38,2)=' ',Null,VAL(MID([Field1],38,2))),  
IIf(MID([Field1],40,2)=' ',Null,VAL(MID([Field1],40,2))), IIf(MID([Field1],42,1)=' ',Null,MID([Field1],42,1)), IIf(MID([Field1],43,2)=' ',Null,VAL(MID([Field1],43,2))), IIf(MID([Field1],45,1)=' ',Null,MID([Field1],45,1)), IIf(MID([Field1],46,4)=' ',Null,VAL(MID([Field1],46,4))), IIf(MID([Field1],50,2)=' ',Null,VAL(MID([Field1],50,2))), IIf(MID([Field1],52,2)=' ',Null,VAL(MID([Field1],52,2)))  
FROM SEG01;
```

Query **mkVICTIM_Table** creates the VICTIM table structure. The table fields are named and data types are set when this query is executed. The relationship with table ADMINISTRATIVE is also created by linking key field UID in table VICTIM with key field UID in table ADMINISTRATIVE:

```
CREATE TABLE VICTIM (SEG TEXT(2), UID TEXT(21), VIC_SEQ_NO LONG, VICOFF1 TEXT(3), VICOFF2 TEXT(3),
VICOFF3 TEXT(3), VICOFF4 TEXT(3), VICOFF5 TEXT(3), VICOFF6 TEXT(3), VICOFF7 TEXT(3), VICOFF8 TEXT(3),

Query **mkVICTIM_Index** creates the VICTIM table index. VICTIM table fields UID, and VIC_SEQ_NO are used as the index fields for table VICTIM. These same fields also become the key fields for table VICTIM once this query is executed:

```
CREATE INDEX PrimaryKey ON VICTIM(UID, VIC_SEQ_NO) WITH PRIMARY

Query **appVICTIM_Data** formats the data from segment-level file SEG04.txt and loads it into table PROPERTY (SEG04.txt is known to the query as SEG04):
